

## Advanced Design Scripting

### Week 10 - Homework

Part 1: Modify the fractals examples from class to produce 2 of the following 3 options:

1. Sierpinski triangle - based on subdivision of a triangle instead of a square.

## Advanced Design Scripting

### Week 10 - Homework

2. Square Kock Curve – based on subdivision of a line into 5 segments instead of 4.

You can explore moving the “kink” proportionally along the line elsewhere than the mid point

## Advanced Design Scripting

### Week 10 - Homework

3. A fractal of your own choosing. Lots of algorithms can be found on the Web

#### **Part 2: Final Project Definition**

Come to class with a list of 4-6 discrete components of your final project development. Here might be some representative examples:

1. Core data model – developing the classes, container objects and methods to manage the data for your application. List the names of the classes, state variables and methods.
2. Functions that your application will need to develop to address the high level intentions of your project. List the names of the functions and what their input parameters (and data types) might be.
3. User interactions – how will the user work with the system? What are the expected inputs, outputs, and ways of iterating? Describe these briefly in bullet points.
4. Saving and retrieval – if the user likes a result, how would the results needed to regenerate or start from a prior example be handled?
5. Integrations – are there are libraries, data sources, etc. that this application will interface with – to retrieve relevant data or to push processed data for solutions?

Write a simple 1 page document listing or narrating these intentions. For each give a current status of 0 (not started) through 5 (100% complete).
